Implications of disruption for you

Confusion in valuation: Lesson 1.01

How do we value? 1.02

Normally the G-Sec is the force of gravity for valuation...

Historically we have seen our markets bottoming out at 11-12x PE (8-9% g-sec) and top out at ~20x trailing PE ...(5% g-sec)

Low/moderate real rates & inflation = Higher P/E

How is value built or lost? 1.03

Higher the ROE and “PSS”, the greater the “terminal value” we are willing to pay...

Volatility/ Cyclicalilty shortens our “discounting horizon period”...

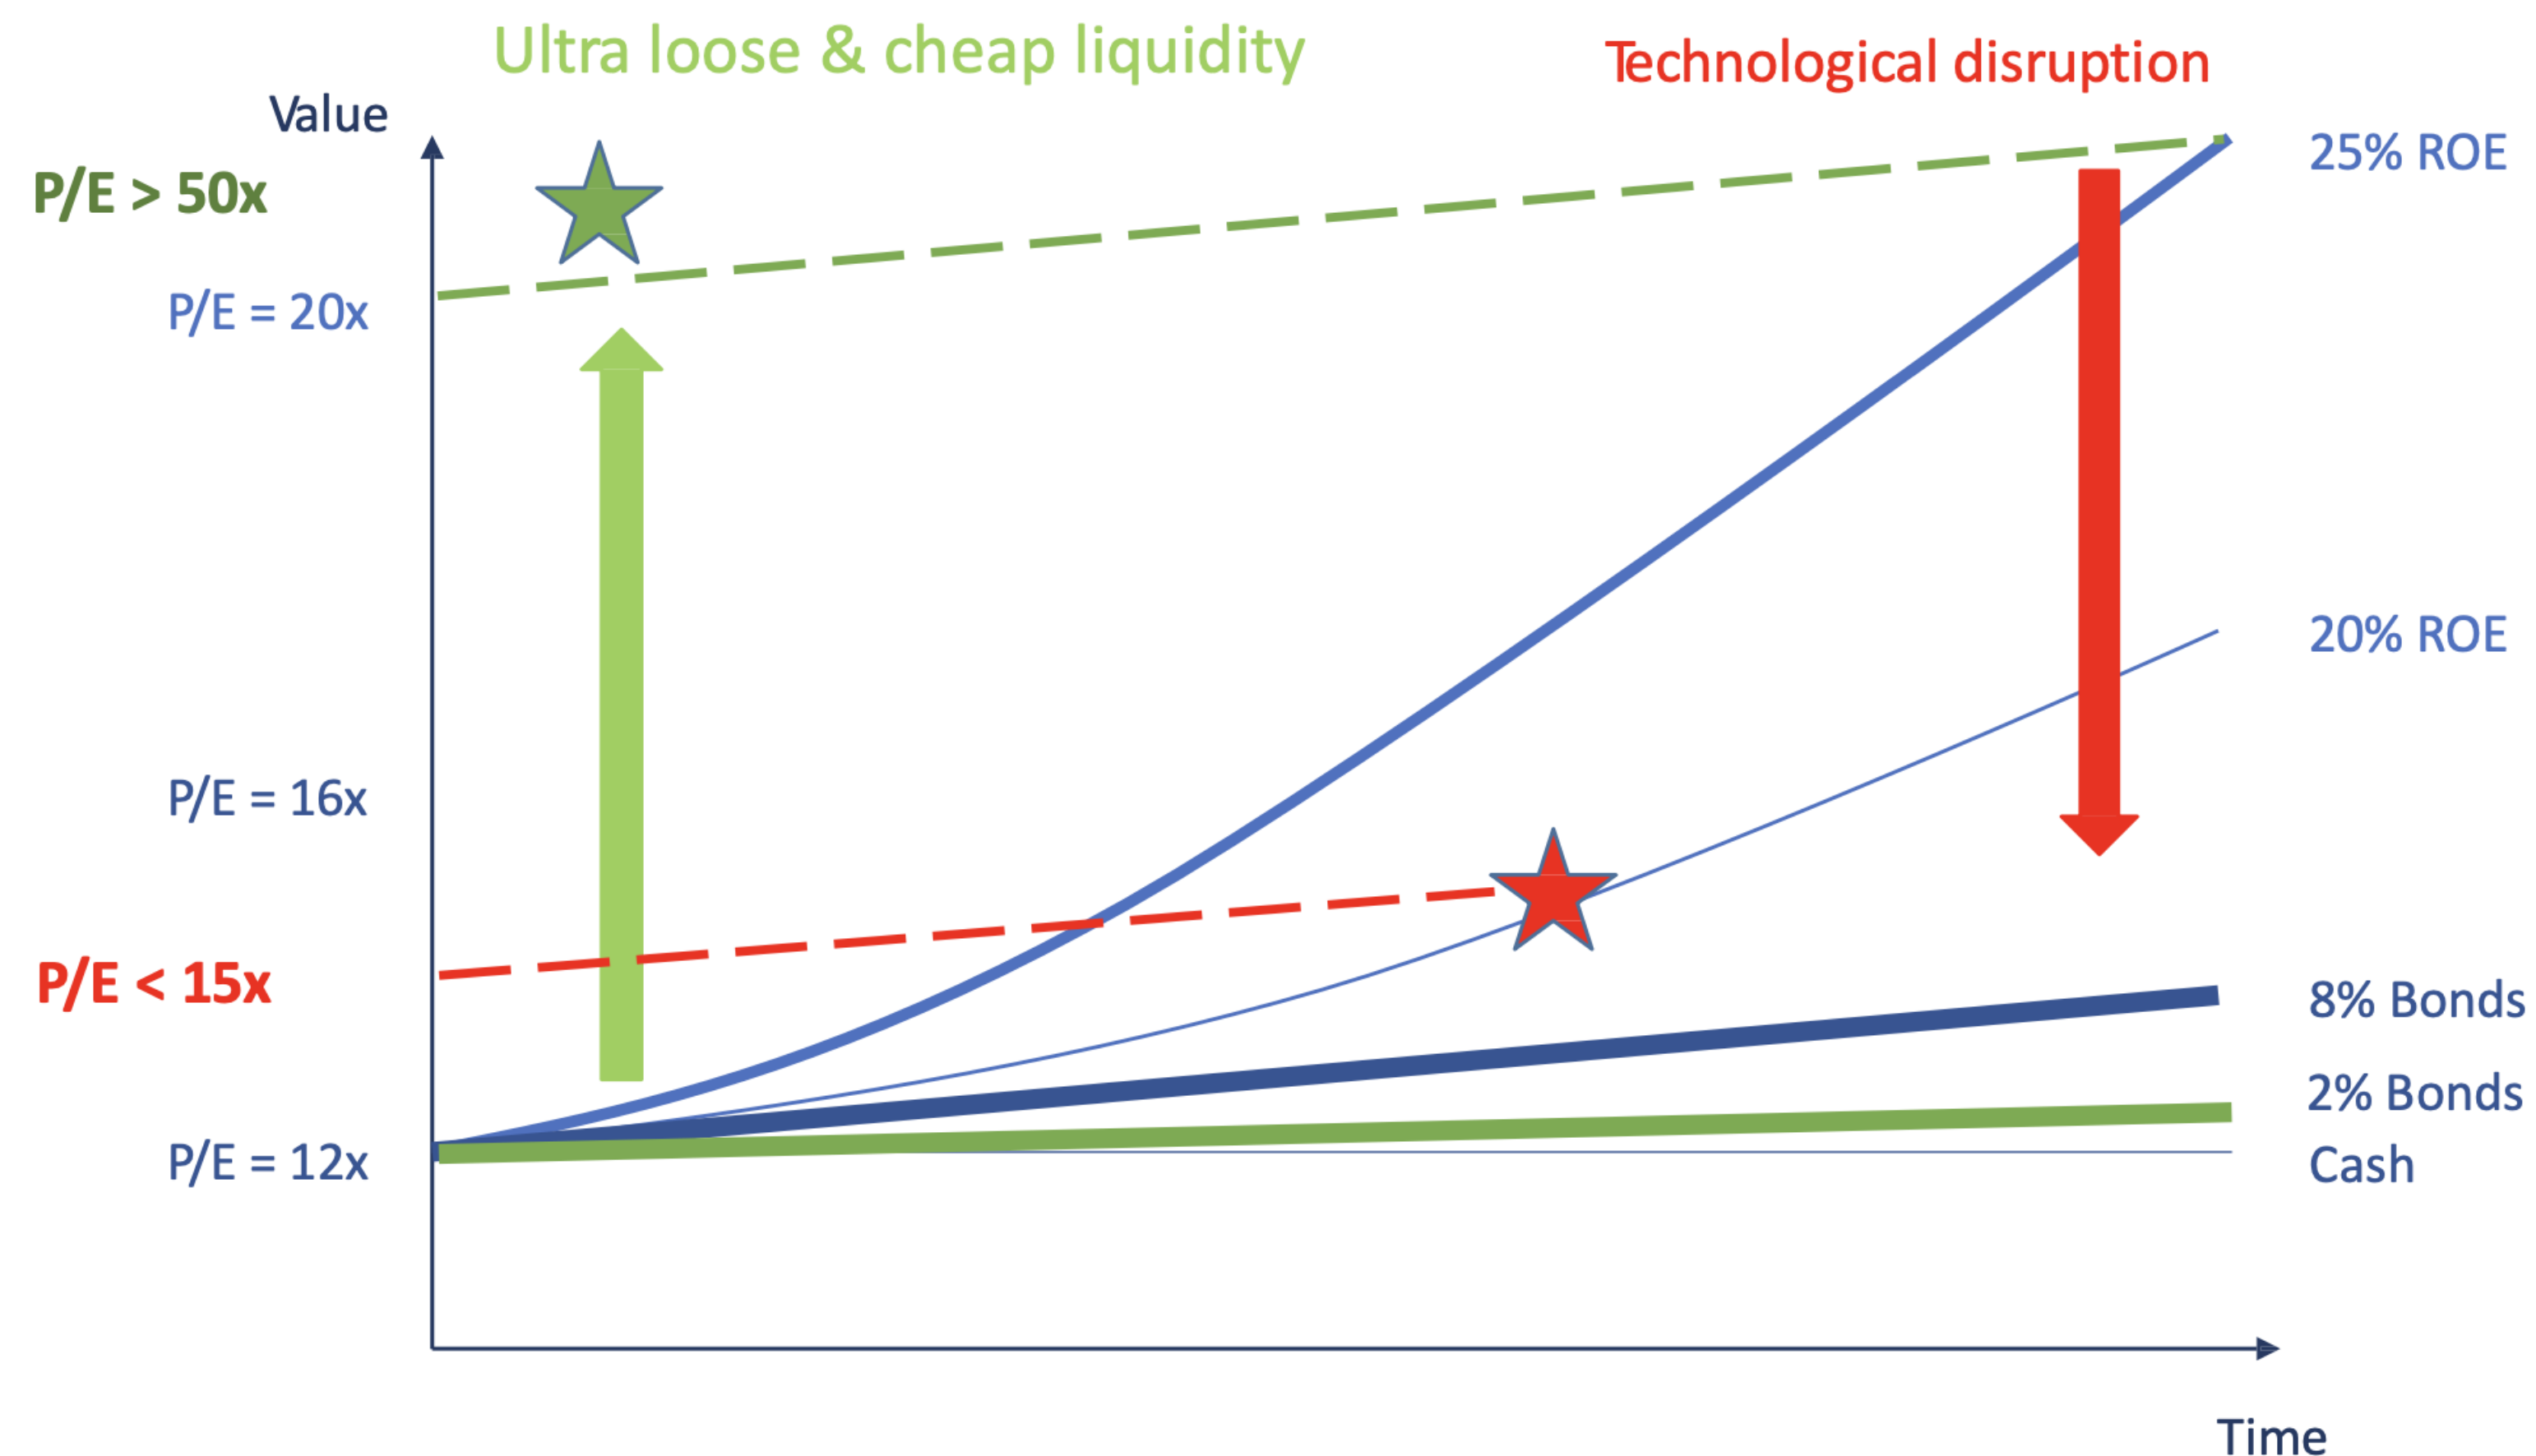

How is value built or lost? 1.04

Small earning surprises can cause massive valuation shifts since our assumptions on duration and gradient change...

A number of things can affect our assumptions: macro, micro, psychology, technology, geopolitics, etc

How do you value this?

Cheap money pushing up valuations currently to historic highs

Technological disruptions threaten to erode terminal values and thereby depress valuations

Markets behaving like schizophrenics... Greed & fear alternate every 6 months!

Q: How do you value a world awash with bonds worth \$ 13 trillion (temporarily?) at negative rates? Deflation?

What is disruption?

What is disruption?

iPhone moment

- **January 7, 2007 : iPhone launched the touchscreen smartphone**
- **August 2007 : <7 months later; Nokia the world leader launched**
 - **“We didn’t do anything wrong, but somehow we lost.....”**
 - **Stephen Elop - CEO**

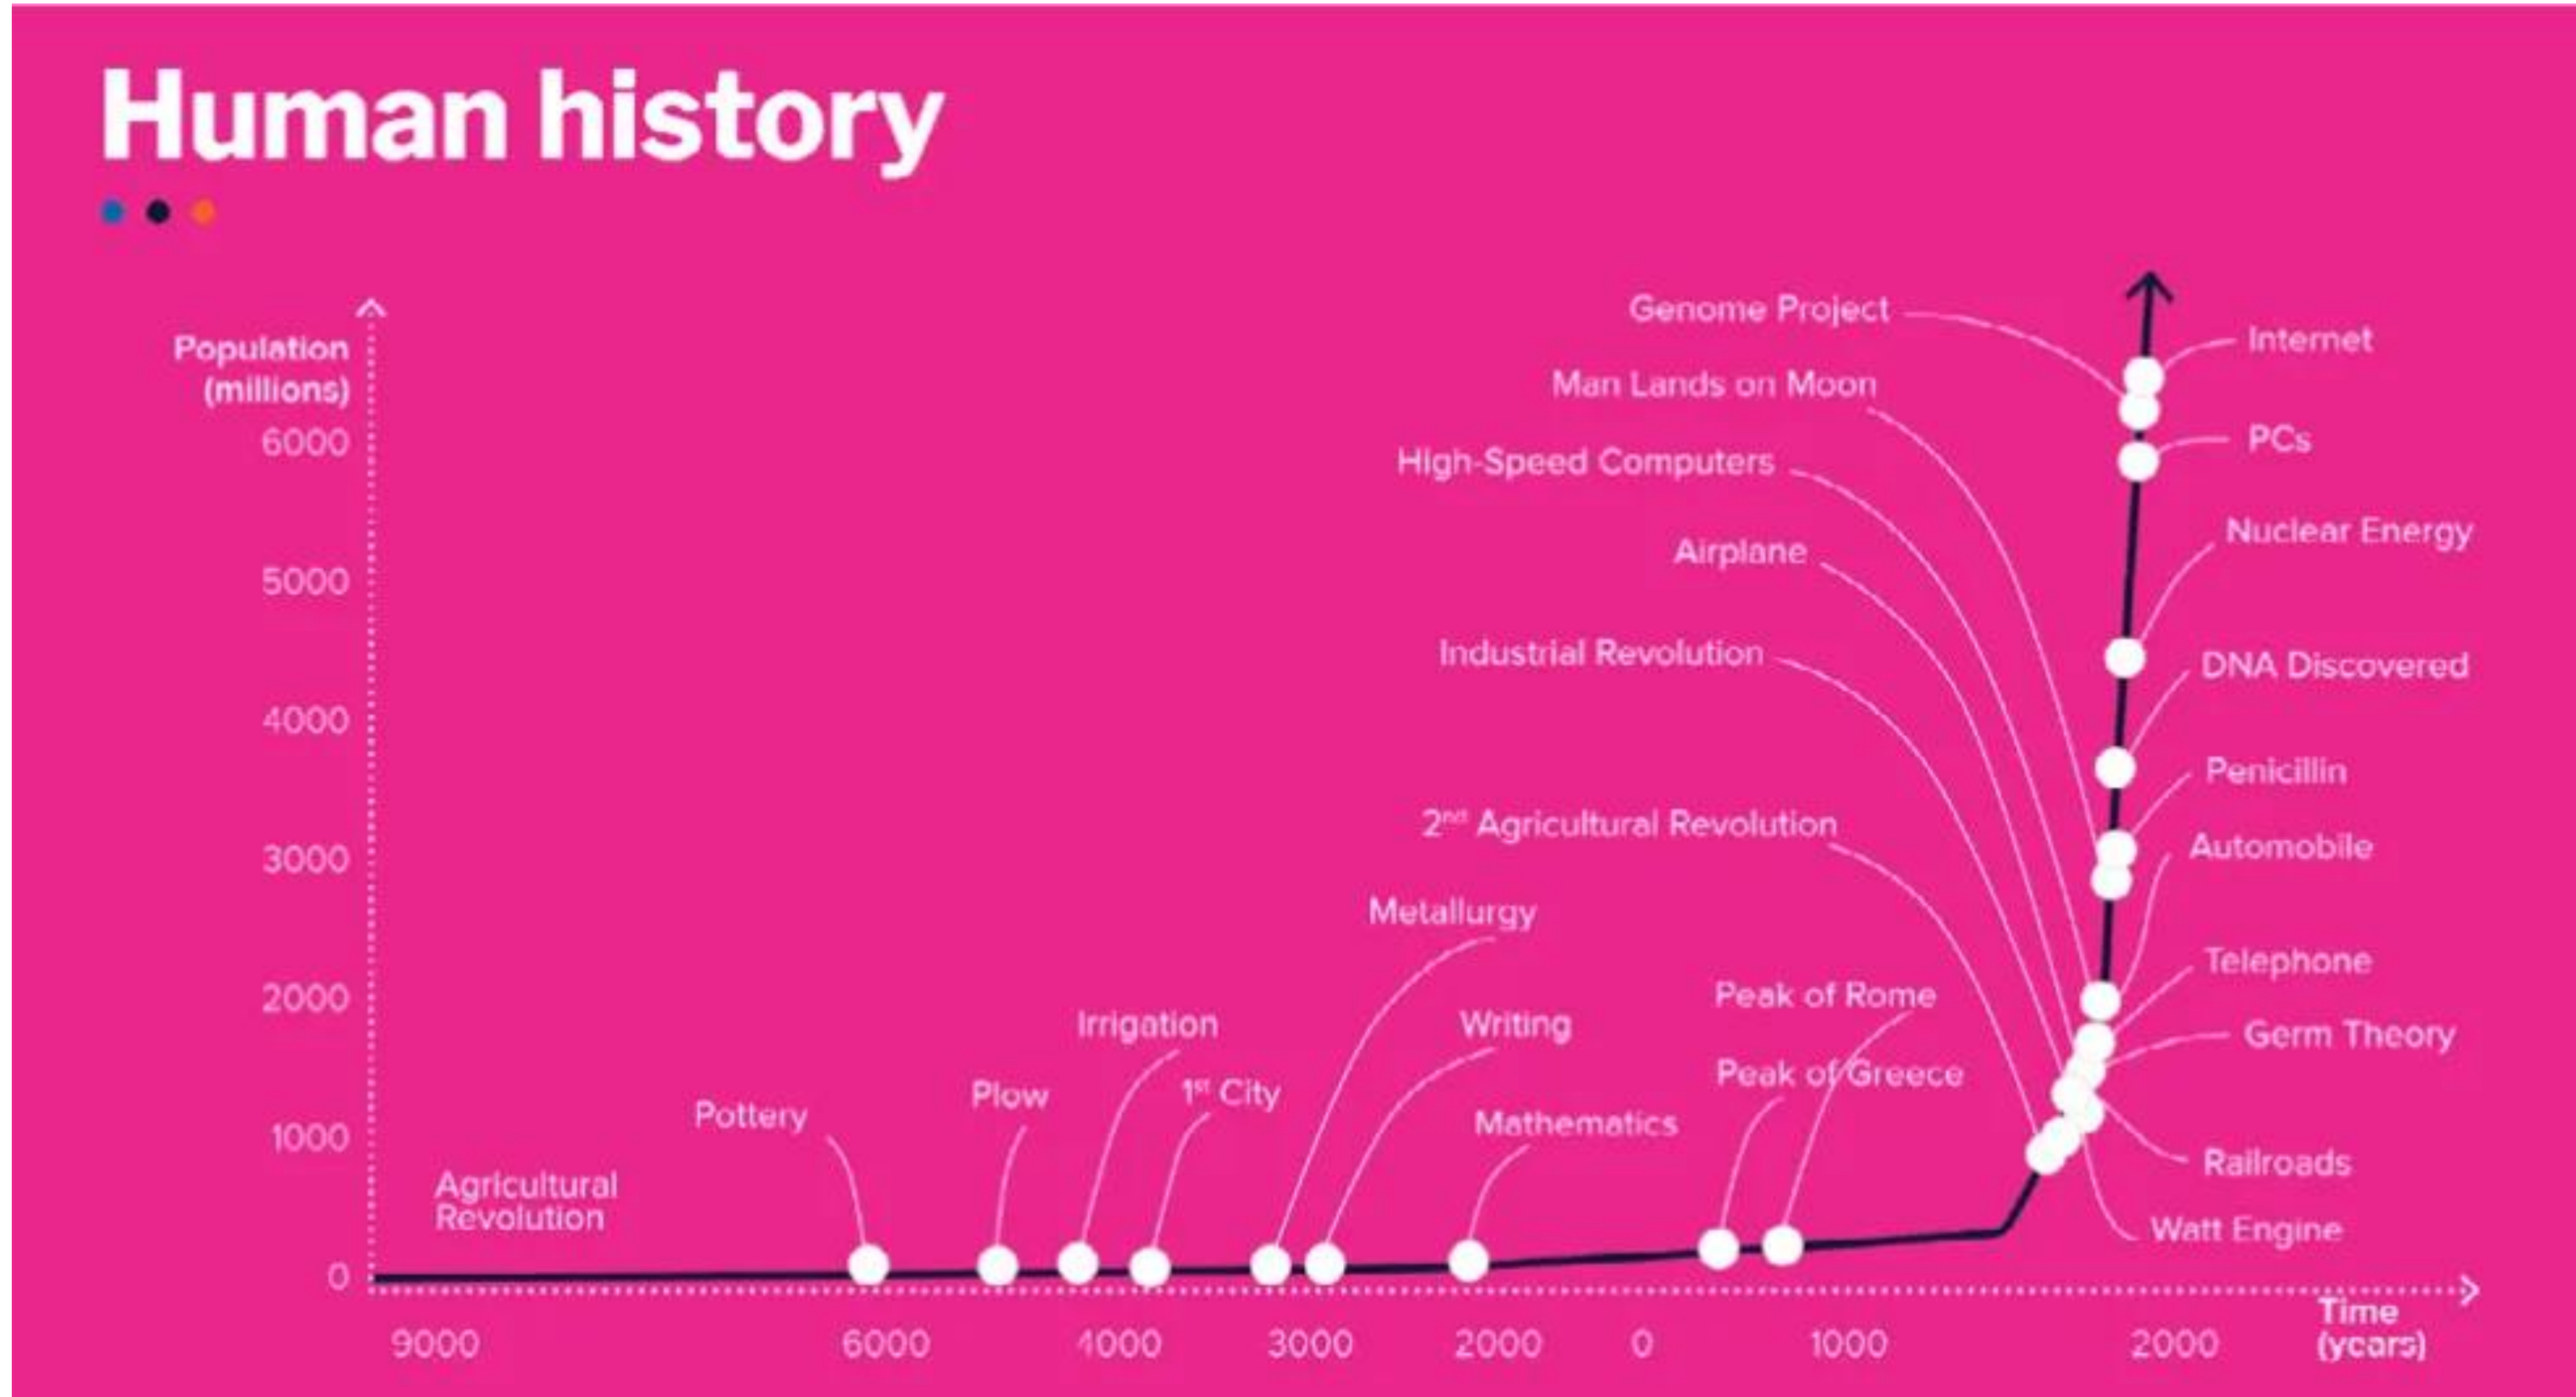

Technological change is exponential

We all know about the magic of compounding – apply this on a LOG SCALE

Disruption has gone exponential

Computing power has gone exponential

Computers already beating humans at chess, AlphaGo.

AI and Machine Learning already allowing algorithms, digital assistants to make human intervention redundant.

Virtual reality is bringing sports alive

Augmented reality – You already use AR everyday

AR = Virtual teleportation

Gaming / AR is the future of technology

I like video games. In fact, that's what got me into software engineering when I was a kid. I wanted to make money so I could buy a better computer so I could play better video games.

- **Elon Musk**, CEO Tesla & SpaceX, 10/16

As a child I played a lot of Avalon Hill board games. And each board game is actually a complex set of rules and circumstances... So it was actually in fact my childhood gaming — for being able to build a model of what a game was — that was essentially the fundamental thing that informs my strategic sense.

- **Reid Hoffman**, Co-Founder of LinkedIn, 8/15

I do think this dynamic around kids growing up, building games, and playing games, is an important one because I think this is how a lot of kids get into programming. I definitely wouldn't have gotten into programming if I hadn't played games.

Healthcare being disrupted

- **Robotics:** **A robot dentist** in China successfully implanted **3D-printed teeth** into a female patient's mouth with "high precision." The only human medical staff involvement was to conduct light setup and a pre-test. Imagine when such robots are in every healthcare facility on the planet, delivering service for the cost of electricity.
- **Virtual Reality:** **VR is also entering the operating room.** In July 2017, University of Minnesota doctors used VR to prepare for a challenging non-routine surgery -- separating a pair of twins conjoined at the heart. Not only was the life-saving surgery a success, the VR prep gave doctors unforeseen insights that prompted them to accelerate the surgery by several months. It won't be long until we refuse to have surgery completed by any human who hasn't prepared in virtual reality using a personalized 3D model.
- **CRISPR/Gene Editing:** Finally, in August 2017, the Food and Drug Administration (FDA) approved the first-ever treatment that uses **gene editing to transform a patient's own cells into a "living drug."** Kymriah, a one-time treatment made by Novartis, was approved to treat B-cell acute lymphoblastic **leukemia** - an aggressive form of leukemia that the FDA calls "devastating and deadly." The FDA is currently considering over 550 additional experimental gene therapies. What happens to our healthy human lifespan as these life-saving treatments demonetize and become universally accessible?

Healthcare being disrupted

Pioneering cancer drug, just approved, to cost \$475,000 — and analysts say it's a bargain

The Food and Drug Administration on August 30, 2017 approved a futuristic new approach to treating cancer, clearing a Novartis therapy that has produced unprecedented results in patients with a rare and deadly cancer. The price tag: \$475,000 for a course of treatment.

The therapy, called a CAR-T, is made by harvesting patients' white blood cells and rewiring them to home in on tumors. Novartis's product is the first CAR-T therapy to come before the FDA, leading a pack of novel treatments that promise to change the standard of care for certain aggressive blood cancers.

Novartis's therapy is approved to treat children and young adults with relapsed acute lymphoblastic leukemia. It will be marketed as Kymriah.

In a clinical trial, a single dose of Kymriah left 83 percent of participants cancer-free after three months, results oncologists have hailed as a major advance for patients with few other options.

Each dose is custom-tailored for an individual patient, requiring a complex process in which human cells must be safely ferried across the country, reliably re-engineered, and soundly returned. To get Kymriah, patients will have to travel to one of just 32 sites around the country. From there, doctors harvest patients' white blood cells and ship them off to a Novartis facility in New Jersey where they can be edited and mailed back. The entire process takes about 22 days, the company said.

DeepMind claims major breakthrough in understanding proteins

Discovery may dramatically speed up discovery of new drugs

DeepMind's AlphaFold program can predict how proteins fold into three dimensions. © DeepMind

Siddharth Venkataramakrishnan in London NOVEMBER 30 2020

82

DeepMind, the UK-based artificial intelligence company owned by Alphabet, has said it can predict the structure of proteins, a breakthrough that could dramatically speed up the discovery of new drugs.

Scientists have spent decades trying to work out how proteins, which begin as strings of chemical compounds, fold into three-dimensional shapes, which then define their behaviour.

Identifying the shape of even a single protein can take years, but DeepMind said its AlphaFold system was able to provide accurate results, to within the width of an atom, within days.

“This advance is our first major breakthrough in a longstanding grand challenge in science,” said Demis Hassabis, founder and chief executive of DeepMind, adding that he hoped it would have “a big impact on our ability to understand disease and the biology of life”. DeepMind was acquired by Google in 2014 for £400m.

Science

AI has almost solved one of biology’s greatest challenges — how protein unfolds

By better predicting how proteins take their structure, scientists can develop drugs more quickly.

MARC ZIMMER 7 December, 2020 1:33 pm IST

A simple chain of amino acids folds into a complex three-dimensional structure | Marc Zimmer

Text Size: A- A+

Solving what biologists call “the protein-folding problem” is a big deal. Proteins are the workhorses of cells and are present in all living organisms. They are made up of long chains of amino acids and are vital for the structure of cells and communication between them as well as regulating all of the chemistry in the body.

This week, the Google-owned artificial intelligence company **DeepMind** demonstrated a deep-learning program called **AlphaFold2**, which experts are calling a **breakthrough** toward solving the grand challenge of **protein folding**.
